Loading the data
raw_data <- read.csv("C:/Users/benny/OneDrive/Documents/Teaching/Data and codes/Time series/costa_rica/</pre>
head(raw_data)
## Year Inflation_rate GDP
## 1 1980
           18.1 4854
                  36.8 2636
## 2 1981
## 3 1982
                  90.3 2619
## 4 1983
                 32.5 3162
                 12.0 3678
## 5 1984
## 6 1985
                  15.1 3941
attach(raw_data)
raw_data$GDP <- as.double(raw_data$GDP)</pre>
str(raw_data)
```

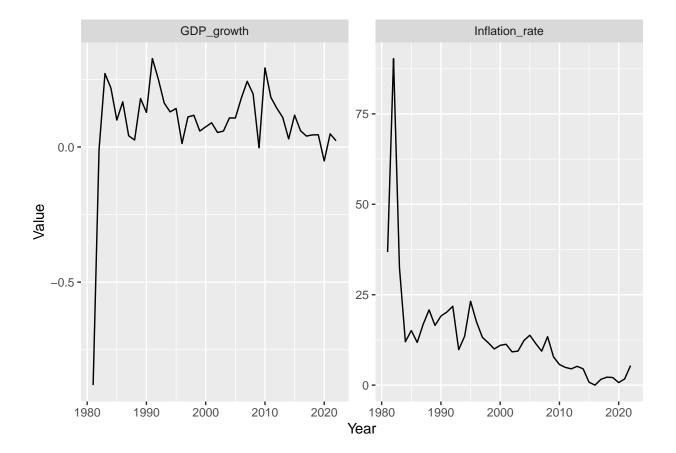

```
## 'data.frame': 43 obs. of 3 variables:
## $ Year : int 1980 1981 1982 1983 1984 1985 1986 1987 1988 1989 ...
## $ Inflation_rate: num 18.1 36.8 90.3 32.5 12 15.1 11.8 16.8 20.8 16.5 ...
## $ GDP : num 4854 2636 2619 3162 3678 ...
```

Calculating GDP Growth rate

```
grw <- function(x){
  diff(log2(x))
}

raw_data <- raw_data[2:43,] ## one can also use raw_data %>% filter(!row_number() %in% 1)
raw_data$GDP_growth <-grw(GDP)</pre>
```

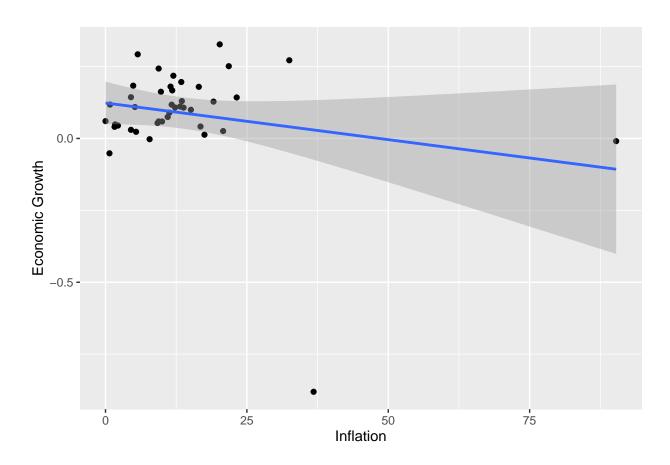

Visualizing the time series plot (GDP growth and Inflation) using ggplot

Visualizing the correlation between inflation and growth. Using a linear fit (OLS) and a non-linear fit (GAM)

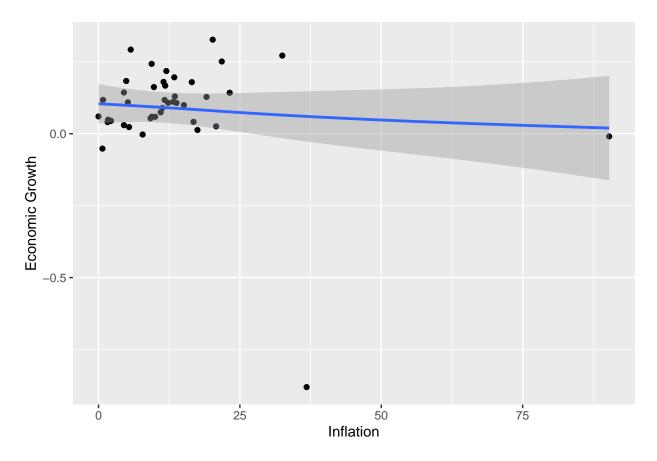

```
ggplot(raw_data, aes( Inflation_rate, GDP_growth))+geom_point() +
geom_smooth(method="lm") +xlab("Inflation")+ylab("Economic Growth")
```

## 'geom\_smooth()' using formula 'y ~ x'

```
ggplot(raw_data, aes( Inflation_rate, GDP_growth))+geom_point() +
geom_smooth(method="gam") +xlab("Inflation")+ylab("Economic Growth")
```

## 'geom\_smooth()' using formula 'y ~ s(x, bs = "cs")'

Using HP filter to obtain long term trend from Inflation and economic growth package (mFilter). Firstly, we transform data into time series after which we extract the trend. Finally we crate a new data frame consisting of the trend inflation and trend growth

```
library(mFilter)

Inflation_ts <- ts(raw_data$Inflation_rate, start=1981, frequency = 1)

GDP_growth_ts <- ts(raw_data$GDP_growth, start=1981, frequency = 1)

Inflation_hp <- mFilter(Inflation_ts, filter="HP")
Inflation_trend <- Inflation_hp$trend

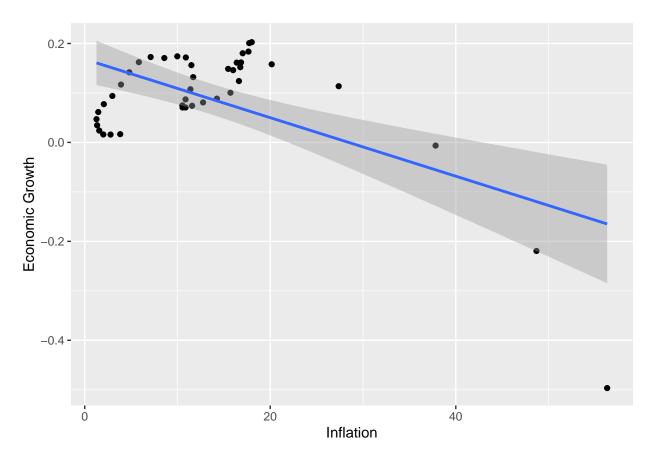

GDP_hp <- mFilter(GDP_growth_ts , filter="HP")
GDP_trend <- GDP_hp$trend

data_new <- data.frame(cbind(Inflation_trend, GDP_trend))</pre>
```

Visualizing the correlation between the long term inflation and economic growth

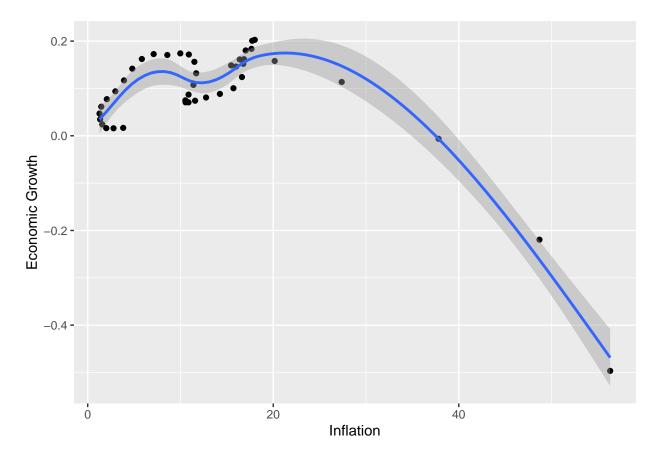

```
ggplot(data_new, aes( Inflation_trend, GDP_trend))+geom_point() +
geom_smooth(method="lm") +xlab("Inflation")+ylab("Economic Growth")
```

```
## 'geom_smooth()' using formula 'y ~ x'
```

```
ggplot(data_new, aes( Inflation_trend, GDP_trend))+geom_point() +
geom_smooth(method="gam") +xlab("Inflation")+ylab("Economic Growth")
```

## 'geom\_smooth()' using formula 'y ~ s(x, bs = "cs")'

Similarly, we use the Baxter and King filter to obtain the long run trend from inflation and growth

```
Inflation_bk <- mFilter(Inflation_ts, filter="BK")
Inflation_bkt <- Inflation_bk$trend

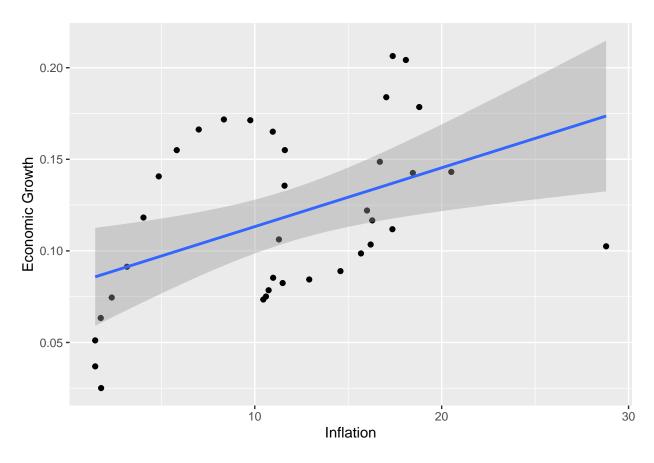

GDP_bk <- mFilter(GDP_growth_ts, filter="BK")
GDP_bkt <- GDP_bk$trend

data_new1 <- as.data.frame(cbind(Inflation_bkt, GDP_bkt))
data_new1 <-na.omit(data_new1)</pre>
```

Once again we visualize the long term relationship between inflation and growth

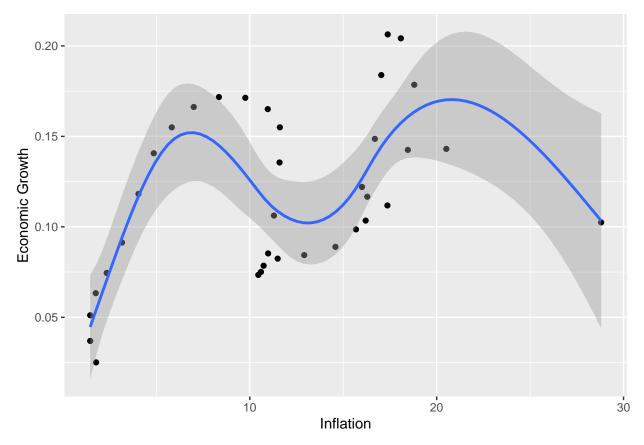

```
ggplot(data_new1, aes( Inflation_bkt, GDP_bkt))+geom_point() +
geom_smooth(method="lm") +xlab("Inflation")+ylab("Economic Growth")
```

```
## 'geom_smooth()' using formula 'y ~ x'
```

```
ggplot(data_new1, aes( Inflation_bkt, GDP_bkt))+geom_point() +
geom_smooth(method="gam") +xlab("Inflation")+ylab("Economic Growth")
```

## 'geom\_smooth()' using formula 'y ~ s(x, bs = "cs")'

we observe an oscilating relationship between the variable (positive at some point and negative at other points). This provides some indication of growth fatigue as inflation increases
